Ecrin

The plan: from testnet beta to Ecrin Wallet.

Everything left to do, every idea so far, and the order to do it in. Each step says who does it: you, Claude (code), or an outside professional.

Version 1 · 31 October 2026 · ecrinprotocol.app

Where Ecrin is today

Done

- ✓ Vault program on Solana devnet, now with USDC (upgraded 31 Oct)
- ✓ Ethereum contract with tokens, ready for Sepolia, Base, Arbitrum, Optimism, Polygon
- ✓ App: portfolio, vault, rules, guardian, activity, network picker, USDC switch
- ✓ Telegram and email alerts for every coin and network
- ✓ WalletConnect, home-screen app (PWA), view mode on phones
- ✓ New landing page, brand kit, X banner, ecrinprotocol.app
- ✓ Tests on every change: rules, program, contract, browser app

Not yet

- Ethereum-style contracts not deployed (needs test coins + one workflow run)
- No independent security audit: test coins only
- No real users testing it yet
- No company, terms of service or legal review
- Upgrade keys are single hot keys (fine for testnet, not for mainnet)

How to read the tables: **You** you do it, **Claude** code I can write, **Both** together, **Pro** an outside professional. Size: S = hours, M = days, L = weeks.

Phase 0 Finish the testnet launch

This week. Nothing here needs new code; it makes everything already built actually usable.

	STEP	WHO	SIZE
1	**Try USDC on Solana devnet.** Free devnet USDC at faucet.circle.com, deposit in the app, request a withdrawal, cancel it, check the alert.	You	S
2	**Deploy the Ethereum-style networks.** Fund your testnet MetaMask account on Sepolia, Base Sepolia, Arbitrum Sepolia, OP Sepolia and Polygon Amoy, then Actions → deploy-evm → all. Optional: add ETHERSCAN_API_KEY so the source is published.	You	S
3	**Test each network once**: ETH and USDC deposit, withdraw, cancel. Report anything odd.	Both	S
4	**WalletConnect check**: ecrinprotocol.app in the Reown allow-list, connect once with Solflare and MetaMask on a phone.	You	S
5	**Find 10 to 20 testers**: crypto friends, and people in gambling recovery (where Ecrin started). A short form, a group chat, and a simple feedback list.	You	M

Phase 1 Quick wins: site and app

Next 2 to 3 weeks. Mostly front-end, so it doesn't touch the contracts and can ship while testers use the beta.

	IDEA	WHO	SIZE
1	**Playable hero.** A mini vault on the landing page: a "thief" requests a withdrawal, the visitor taps Cancel and sees "Kept safe". The whole idea in five seconds.	Claude	M
2	**French version** of the site, app and alerts. You're in Québec: it's the first audience to win.	Both	M
3	**Cancel straight from the alert.** The Telegram and email alerts get a one-tap link that opens the app on that exact withdrawal, ready to cancel.	Claude	S
4	**Phone push notifications** from the home-screen app, on top of Telegram and email.	Claude	M
5	**Live numbers from the chain** on the landing page: vaults created, value protected, withdrawals cancelled. Real and verifiable.	Claude	M
6	**Security page**: how it works, what's tested, audit status, how to report a bug, and the GitHub test results.	Claude	S
7	**Ecrin Wallet waitlist** on the site (email sign-up, stored by the existing worker).	Claude	S
8	**Named trusted addresses**: "Bank off-ramp", "Cold wallet" instead of raw addresses, with a warning when a withdrawal goes to a lookalike address.	Claude	S
9	**Guides**: "My seed phrase leaked, what now?", "Protecting crypto for your heirs", "Ecrin + a hardware wallet". Search traffic and trust.	Both	M
10	**Privacy-friendly analytics** (no cookies) to see where visitors drop off.	Both	S

Phase 2 Vault features (before the audit)

These change the program and the contract. They go in before the audit, so the auditors check the final code once. Pick the ones testers ask for; not all are needed for mainnet.

	FEATURE	WHO	SIZE
1	**Panic freeze.** One tap locks everything for N days. Instant, because it only makes rules stricter. The button you want when you think you've been hacked.	Claude	M
2	**Spending allowance.** A small hot balance that refills from the vault each day, up to a cap. Daily convenience without daily risk.	Claude	L
3	**Several guardians** (2 of 3 must agree). Stronger emergencies and recovery than one person.	Claude	L
4	**Inheritance.** If you're inactive for N months, a beneficiary can request a withdrawal, still with a long delay you can cancel. Plus a printable "recovery kit" for your family.	Claude	L
5	**Scheduled payments** to trusted addresses (rent, savings plans).	Claude	M
6	**Recovery mode for gambling**: an optional "why am I withdrawing?" note, and the guardian is told about every request.	Claude	S
7	**Hardware wallet signing** tested end to end (Ledger with Phantom and MetaMask).	Both	S
8	**More stablecoins** (USDT on Ethereum, PYUSD) once USDC has been used for a while.	Claude	M
9	**Monthly "attack drill"**: a reminder to request and cancel a tiny withdrawal, so people know the cancel button works before they need it.	Claude	S

Phase 3 Audit and mainnet

The gate for real money. Nothing after this phase should ship before it.

	STEP	WHO	SIZE
1	**Code freeze and internal review**: extra property and fuzz tests on the rules ("no path moves funds without the delay").	Claude	M
2	**Company and legal**: a company behind Ecrin, terms of service, privacy policy, and a lawyer's check on Québec and Canadian rules for a non-custodial crypto app.	You Pro	L
3	**Independent audit** of the Solana program and the Ethereum contract by a firm that does Solana and Solidity. A public audit contest is a cheaper alternative or a good second pass. Budget for this early: it is the biggest cost before launch.	Pro	L
4	**Fix findings**, get the fixes re-checked, publish the report.	Both	M

5	**Bug bounty** with a public reward for anyone who finds a flaw.	You	S
6	**Safer keys**: upgrade authority moved to a multisig (e.g. Squads), deployer keys out of GitHub secrets for mainnet, and later the program made immutable.	Both	M
7	**Mainnet with deposit caps**, raised step by step. Monitoring and a written incident plan.	Both	M

Phase 4 Ecrin Protocol for existing wallets

Bring Ecrin to people where they already are: Phantom, Solflare, MetaMask, Backpack, Rabby.

	STEP	WHO	SIZE
1	**SDK** (an npm package): any wallet or app can show a user's vault, countdowns and a Cancel button in a few lines.	Claude	M
2	**Solana Actions (Blinks)**: "Cancel this withdrawal" works right inside X and Telegram.	Claude	M
3	**Docs site** for developers and partners.	Claude	M
4	**Partnerships**: pitch "Protect with Ecrin" to wallets and to treasury tools (Squads). The audit report is what opens these doors.	You	L

Phase 5 Yield, without a fast way out

	STEP	WHO	SIZE
1	**Native SOL staking inside the vault**: earn rewards, keep every delay. No receipt token, so nothing to sell around the rules. Needs its own audit.	Claude Pro	L
2	**Opt-in stablecoin yield**, only with a well-known lending protocol and its own audit. Clearly marked as extra risk.	Claude Pro	L

Phase 6 Ecrin Wallet: Chrome extension, then mobile app

A wallet where savings live in the vault by default and only a small allowance is spendable.

How it's built

- **One shared core** in TypeScript: keys, Solana and Ethereum support, the Ecrin vault client (chain.js / evm.js already exist), and a check of every transaction before signing.
- **Chrome extension** (Manifest V3): the key is stored encrypted with a password; websites see it the same way they see Phantom and MetaMask, so dApps work with it. React popup.
- **Mobile app** (React Native with Expo): keys in the phone's secure storage (Keychain / Keystore) behind Face ID or a fingerprint. Not a wrapped website: that's weaker for holding keys.
- **What makes it Ecrin**: vault by default, spending allowance, every outgoing transaction explained in plain words before you sign ("this goes to a new address and will wait 72 h"), cancel and alerts built in.

	STEP	WHO	SIZE
1	**Shared core** with full tests.	Claude	L
2	**Chrome extension**: simpler to build and test, and store review is faster. Beta to the waitlist first.	Claude	L
3	**Wallet security audit** (key storage, the extension's connection to websites).	Pro	L
4	**Mobile app** on iOS and Android. App stores need the company and terms from Phase 3.	Claude You	L
5	**Later**: passkeys instead of seed phrases, family and team vaults, an Ecrin card for spending from the allowance.	Both	L

The order, in one list

01 **Test USDC on Solana**, deploy the Ethereum-style networks, test them, and check WalletConnect. You

02 **Recruit 10 to 20 testers** and start a feedback list. You

03 **Playable hero, French version, cancel from the alert**. Claude

04 **Panic freeze** and the **recovery mode for gambling**: small program changes with a big impact. Claude

05 **Push notifications, live numbers, security page, waitlist, named addresses**. Claude

06 **Start the company and legal work** in parallel; it takes the longest. You

07 **Decide which Phase 2 features go into v1**, based on what testers ask for (allowance, several guardians, inheritance, scheduled payments). Both

08 **Code freeze, internal review, then the independent audit.** Pro

09 **Fix, publish the report, bug bounty, multisig keys, mainnet with caps.** Both

10 **SDK, Blinks and docs**, then pitch wallets and treasury tools. Claude You

11 **Ecrin Wallet**: shared core, Chrome extension, wallet audit, mobile app. Claude Pro

12 **Yield**: staking inside the vault, then opt-in stablecoin yield, each with its own audit. Claude Pro

Rules that don't change

- No real money before the independent audit.
- Never paste private keys, seed phrases or API keys into chat or GitHub; secrets go into Cloudflare or GitHub secrets only. Testnet keys stay testnet-only.
- Every contract change gets tests first, and goes into the next audit.
- Be honest on the site: audit status, test coins, and that Circle can freeze USDC.

This plan will change as testers give feedback. Ask for a new version any time.
